The diagram represents a conceptual model and logical design of a pipeline hierarchy. The pipeline hierarchy includes elements such as assets, conditions, and network routes, which are connected by various pipelines and routes. The model is designed to support pipeline management by providing a clear visualization of the pipeline system and its components. The diagram includes various icons and symbols to indicate the different types of pipeline features, such as valves, pipelines, and network routes. The model is structured to show the relationships between these elements, allowing for efficient management and analysis of pipeline data.
